

3 Signs Your *AI Agent Has No Memory*

Fast responses can hide a slow-moving problem. Here's what to actually look for.

01

It repeats questions you already answered.

WHAT IT LOOKS LIKE

"You just gave it your account email. Two messages later, it asks again."

Every answer you give should update what the agent knows — not disappear the moment the conversation moves on.

02

It loses context mid-conversation.

WHAT IT LOOKS LIKE

"You ask a follow-up, and it responds like your last message never happened."

Without memory, each reply is generated from the current prompt alone — not the thread of what you've actually been discussing.

03

It treats every chat like the first one.

WHAT IT LOOKS LIKE

"You come back tomorrow with the same issue, and it greets you like a stranger."

No memory means no history — every session starts from zero, no matter how many times you've talked before.

None of this is a prompting problem. *It's a memory problem.*

Recognizing the symptoms is step one. Here's what actually fixes it.
